

DELFIN TECHNOLOGIES - INNOVATIVE SKIN MEASUREMENT INSTRUMENTS

NEW!

SEBUMSCALE

SKIN SEBUM MEASUREMENTS
MADE EASY

PRACTICAL

ACCURATE

WIRELESS

PRODUCT BENEFITS

Sebum excretion measurements with absolute units are now possible for the first time. The sensitive new SebumScale measures the amount of sebum in microgrammes. The measurements are accurate, fast and easy.

The SebumScale is fully portable and battery operated. This offers advanced flexibility and the possibility of measuring virtually any body site. The SebumScale may be used as a stand-alone device or measurement data may be collected to the DelfWin software.

The DelfWin software allows users to set up individual projects and print and export results for data editing and handling.

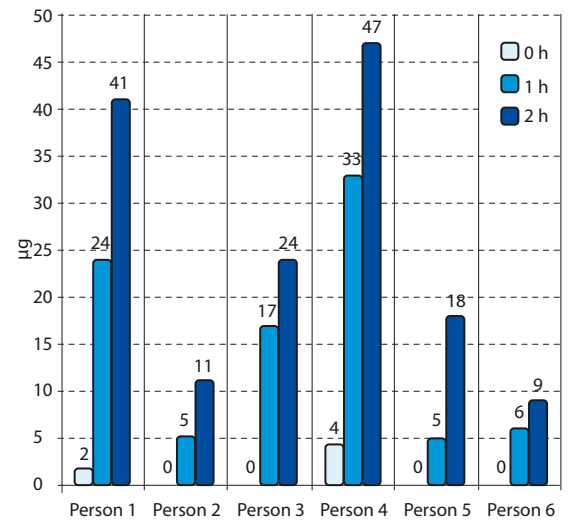

APPLICATION AREA

The SebumScale is designed for the accurate measurement of sebum excretion from the skin. The reliable SebumScale is thus a powerful tool in product research and development, skin type assessment, claims substantiation work and various skin research studies.

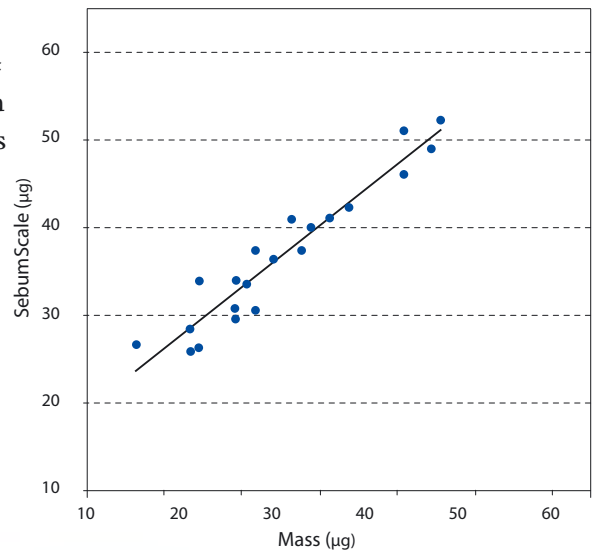

SEBUMSCALE INSTRUMENTATION AND MEASUREMENT PRINCIPLE

The SebumScale is a compact instrument applying microbalance technology for accurate and repeatable mass measurements. The SebumScale has a disposable sensor with an effective measurement area of 65mm². The sensor is placed briefly on the skin and the instrument then measures the mass of the sebum collected from the skin in 1 µg resolution.

SEBUM EXCRETION AFTER SKIN CLEANSING

SEBUMSCALE CORRELATION WITH PRECISION BALANCE

DELFIN INSTRUMENTS ARE USED
WORLDWIDE IN OVER 30 COUNTRIES
ON 6 CONTINENTS
